§ 371 (c)(1),

(2), (4) Date: **Jun. 20, 2014**(57) **ABSTRACT**

Provided are methods, corresponding apparatuses, and computer program products for providing mobility control for local area networks. A method includes connecting a user equipment to a first base station, wherein the first base station and the use equipment are connected with a second base station; and disconnecting the first base station from the second base station and connecting the first base station to a third base station during a handover of the user equipment from the second base station to the third base station. With the claimed inventions, mobility of a user equipment in local area networks can be well controlled and thus service continuity would be maintained, resulting in a robust user experience.
